Tree census and inventory report

Introduction

Background

The present document is a Tree census and inventory report of the Satara Nagar Parishad, Satara in Satara district. The geographical area of Satara Nagar Parishad is 8.15 Sqkm and Population is 2,31,885. The study was commissioned by Satara Nagar Parishad in order to quantify, map and to create an inventory of Tree species in the actual area i.e. core area of the proposed project. The objectives of this study were to provide an assessment of Tree species diversity, population and distribution in the given Village area. The study also evaluated the present status of Tree individuals and their importance. The study gives a detailed account of Tree diversity, health status, density, distribution and their locations by using Google Earth and mapping tool.

Location of the project: -

The project site is located in Satara, district of Satara.

Tree and Tree census

The present document considers definition of Tree with respect to Tree Act 1975, as perennial woody plant with girth and height of 10 cm and 2 mts. respectively. For the present study, the tree census was carried out by using modern Kobo toolbox (free source app) to create a more efficient, portable and comfortable database of tree species. The tree census is an important scientific, technical, and educational effort. The results enable us to characterize the tree population in terms of its structure, function, and value. This information is used in a variety of ways, including:

Management : Enables daily and strategic decision-making based on the composition, condition and distribution of trees.

Planning : Tracking the changes that have occurred in the landscape and predicting or analysing the changes / impacts that the proposed project will have on the landscape.

Mitigation : Understanding of number, diversity and density of trees helps in developing appropriate mitigation measures.

Scope of the study

Objectives

1. To make an inventory of tree individuals and tree species in the proposed project site
2. To create a distribution / vegetation map of the whole area representing Tree individuals
3. To undertake ecological analysis and calculate the following:
 - a. IVI (Importance Value Index calculation)
 - i. Frequency and relative frequency
 - ii. Density and relative density
 - iii. Dominance and relative dominance
 - b. Simpson's biodiversity Index calculation
4. Assessment of species protected by specific legislation (Rare, endangered, critically endangered, endemic and vulnerable)
5. To enumerate importance of the Tree species/individuals observed

Materials and Methodology

Sampling methodology

Since the purpose of the project was to create a detailed inventory of Tree individuals and species, the "Census" was used as a sampling technique.

In total, 8.15 Sqkm of the project site were surveyed and each tree was counted and marked on a GPS device. The data collection was done from all units in the population and a 'complete enumeration' of the population was done. The census technique was specifically used to collect accurate information of the population. Some inaccessible locations on mountainous tracks/valleys were surveyed by using strategic

representative belt transects. The data from the representative belt transect was extrapolated to the areas where it was not possible to reach.

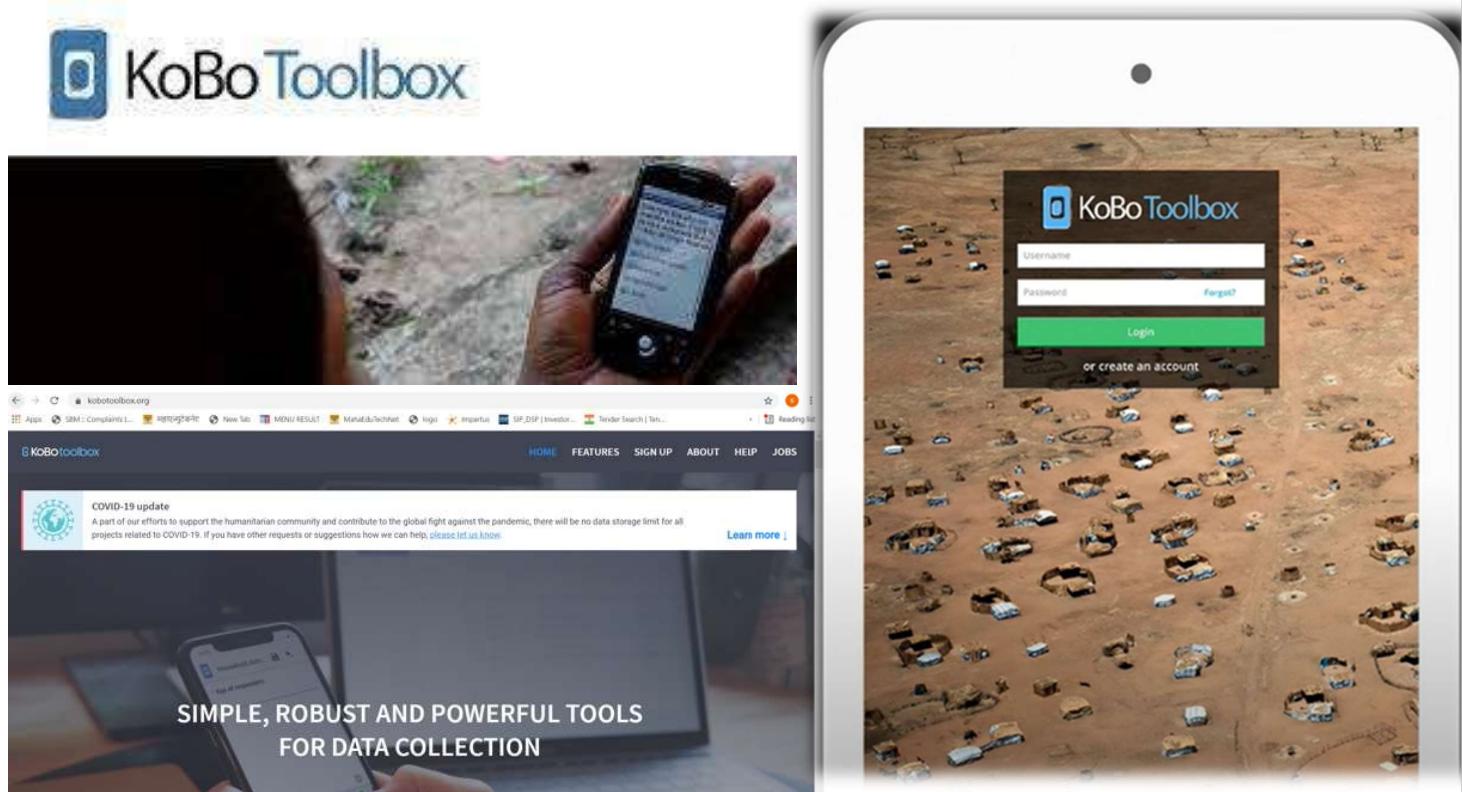

Identification of Tree species

Most of the tree species encountered were identified on field on the basis of their morphological characters - Bark shape, texture, and colour, Leaves-shape, size, texture, colour, arrangement, flower and fruit colour, shape, size, internal morphology, odour and arrangement of reproductive features. Morphological characteristics were used to identify the Tree species to the species level. The Flora of Maharashtra, and Bombay Presidency were used as references and online database of The International Plant Names Index (IPNI) was used to find out the latest and acceptable international scientific name of the Tree species.

Some of the Tree species that could not be identified on field were collected or photographed for off-field analysis. The Tree species that could not be identified due to lack of morphological signs/characteristics were grouped in to the Un-Identified section (subjected to identification in another season).

Technology used

GPS device along with the Tree mapping software of Trimble make was used to take GPS positioning of each tree individuals and to caporal structural parameters. ArcGIS was used as platform to create GIS based maps.

Dashboard

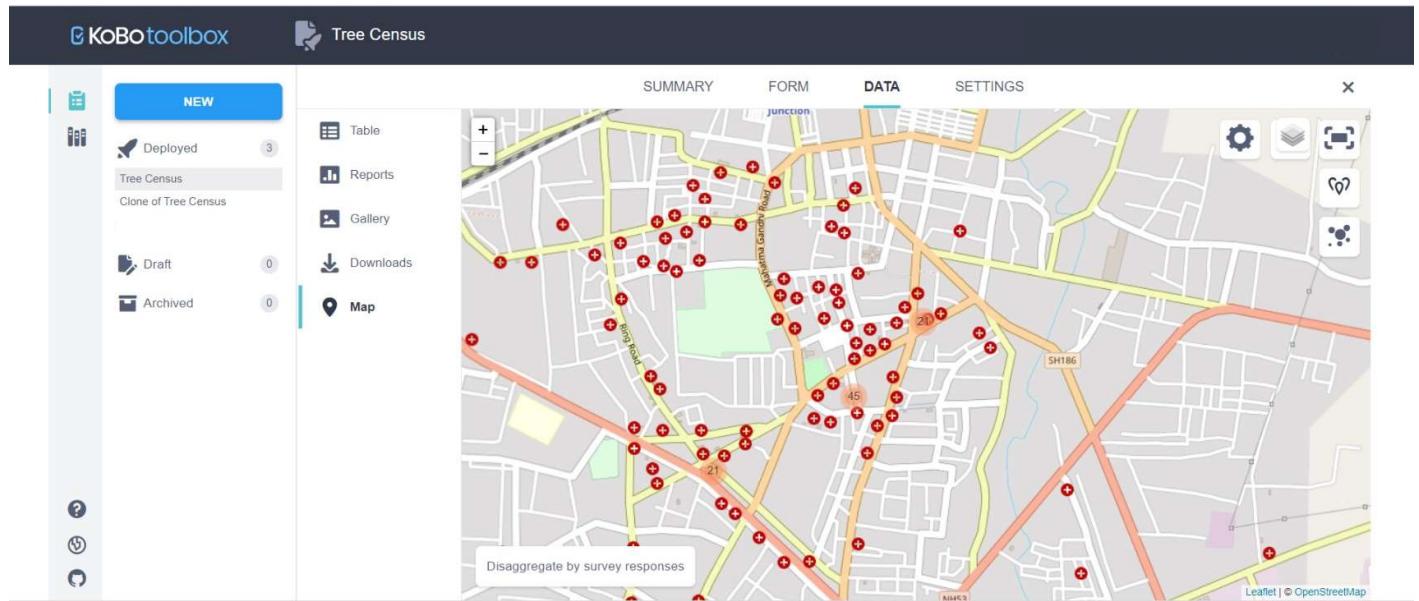

This option envisages various analytics and are visualized in the form of pie charts. The total number of field officers on work on a given day can be seen, the total count of the given day can be seen and thereby the total count till date can be seen on the dashboard. The timeline option is available on the dashboard which will help to understand the trend of the work being done. Similarly, a pie chart reflecting the top 5 field officers based on their tree count can be seen.

The screenshot shows the KoboToolbox interface with two main windows open:

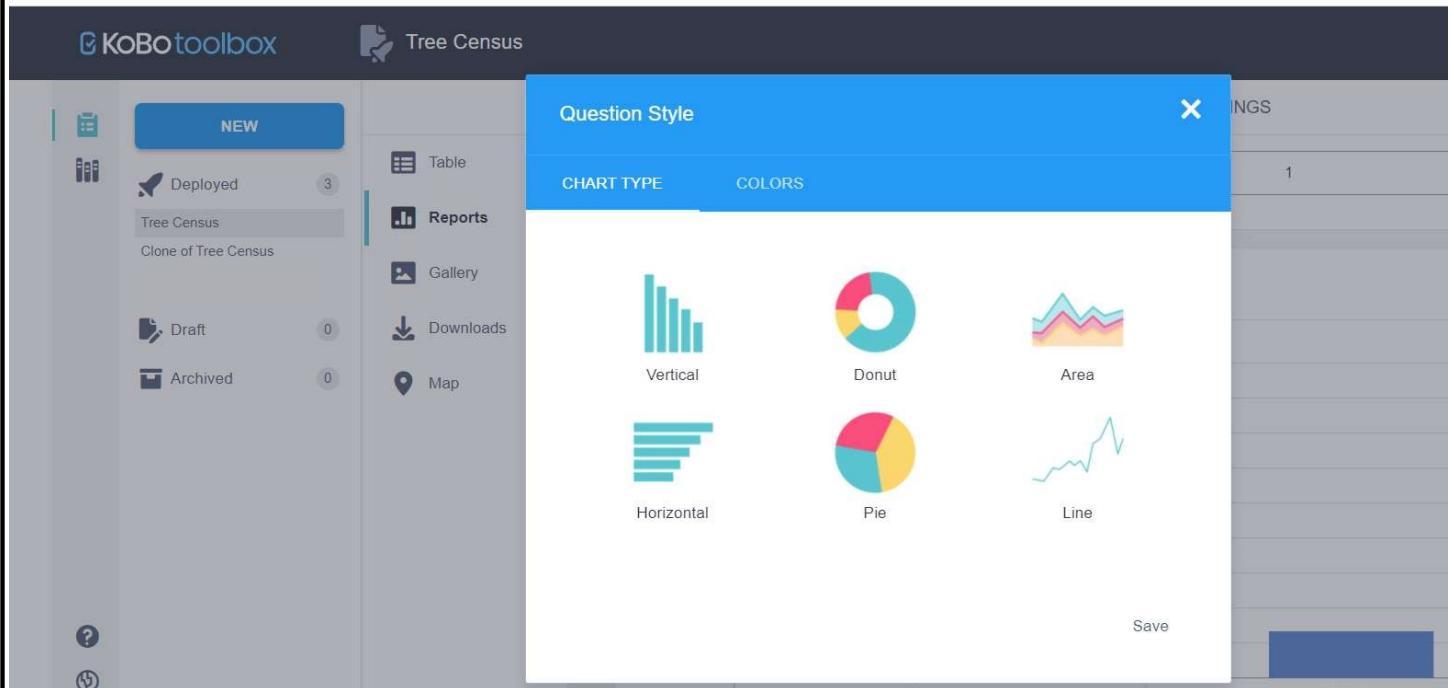

- Create Library Item Modal:** A central modal window titled "Create Library Item" displays four options: "Question Block" (document icon), "Template" (T icon), "Upload" (up arrow icon), and "Collection" (folder icon).
- Downloads Section:** On the right, under the "Tree Census" project, the "Downloads" tab is selected. It includes settings for export type ("XLS") and value format ("Labels"), an "Advanced options" dropdown, and a "Latest unsaved settings" dropdown. A large blue "EXPORT" button is prominent. Below this, the "Exports" section lists a single entry: "XLS" created "Yesterday at 1:34 PM" with "Labels" as the value format, "No" for "Include Groups", and "Yes" for "Multiple Versions". There are "Download" and "Delete" buttons for this entry.

Map

The map gives the visual representation of the tree census work. The corporation and ward boundaries of the Satara Nagar Parishad are assigned in the map. Thus, based on this the area covered and percentage completion of the work can be understood.

Various other pie charts depicting the Tree condition, the ongoing wards, common and uncommon trees can be seen on the dashboard.

Observations

Trees in count

The census study was carried out during the month of Nov- 2023 to create an inventory of Tree species. During the study, a total of 599286 trees were mapped and measured. Of the 599286 individuals counted.

The 599286 number of Trees that were observed during the survey belonged to 50 species.

There were few areas in the project location which were had fewer number of trees while there are few forested regions which had trees in large numbers and were densely covered by Tree species.

The overall survey area was divided in to the 5 following sections on the basis of population of Trees:

1. Orchards and Residential Areas
2. Mountainous and forested areas
3. Agricultural land with mixed tree species
4. Agricultural land
5. Land with no tree species

It can be seen from the below given map that there are several sections in the study area which are low in density and diversity of Tree species.

Most of the tree individuals observed was in the forested areas.

Maximum number of the tree species is forest based and native species. Also, most of these dominated species are restricted in the forested patches only. The trees observed in the agricultural zones are less in diversity and mostly dominated by *Bombax cieba* (kate savar).

List of Tree individual as observed along with details is attached in the Annexure 1 of this report.

Also, a Google earth compatible KML file is provided as a soft copy.

The GPS positioned of all the tree individuals observed in the study is super imposed on the AutoCAD map of the project. The soft copy of this superimposed file is provided.

Outcomes of the Tree census work

It is one of the best tool for the management and maintenance of Village's green cover as well as native biodiversity. It also helps in understanding the species composition of the studied area, tree to human population ratio, monitoring and maintenance, management of defective trees, carbon sequestration potential, etc.

Results and Conclusions :-

A data set consisted of tree data of 599286 individuals. The results are obtained based on individual tree count, ward wise tree count, ownership wise, height wise, age wise, canopy wise and condition wise. The results obtained are as follows

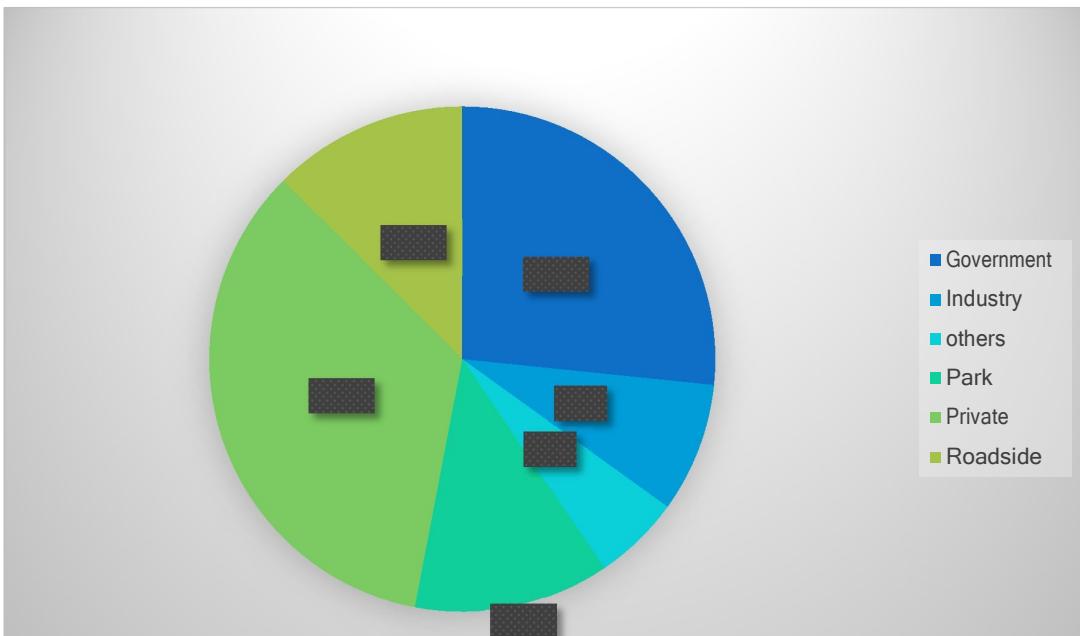

Individual Wise Tree data :

Pimpal was the most dominant tree species with occurrence to the entire population of trees within the Village. It was followed by Vad , Amba , Kaduneem and etc.

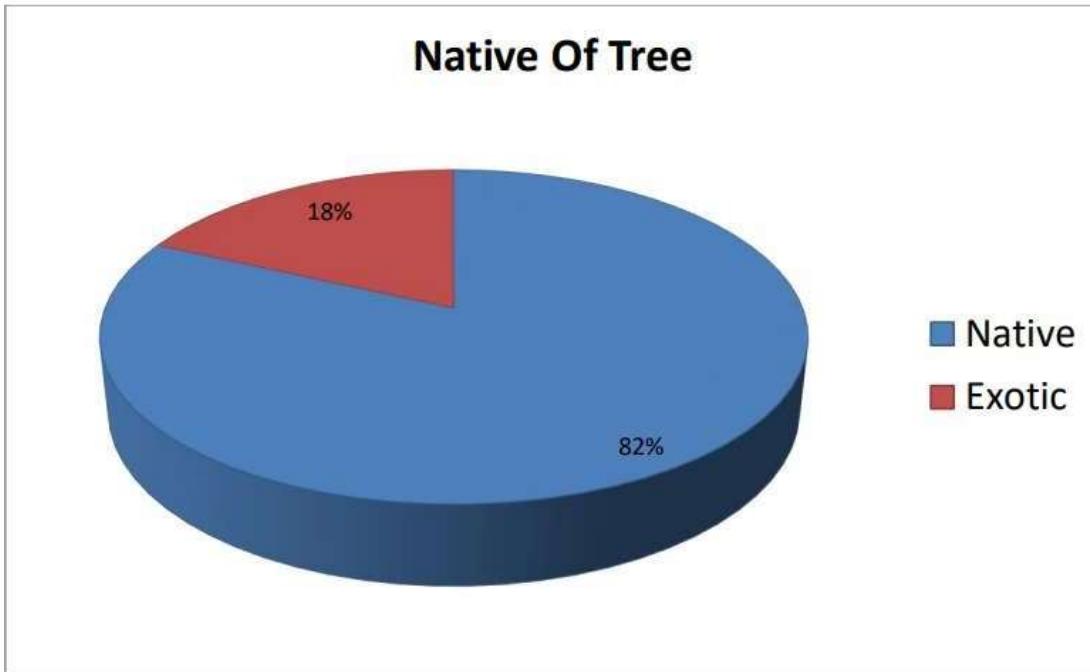

Ownership wise tree data :

Maximum trees were recorded from Private sector as on privately owned land followed by Government, Roadside and other. The Government land is divided into Forest land, Defence land and land under Gram panchayat i.e. GP, Satara Nagar Parishad.

Native Wise Tree data :

Out of the total 599286 trees 88% of trees are indigenous and 12 % of trees are Exotic in Nature.

Recommendations

Plantation

- Tree count in park and industrial premises is very low. These two areas have good scope of new plantations.
- Prabhags have large open space and should be consider for newplantations.
- Invasive tree population is high and hence preference should be given to native flora.
- Species diversity of native flora is good and thus Village supports native vegetation.
- Tree species belonging to Fig family like Vad, Pimpal, Umbar, etc which are native trees should give preference for new plantation. This will not only increase green cover but also supports many other life forms like Birds, Arboreal Mammals, insects, etc.
- Plantations, Conservation and maintenance of Endangered and Vulnerable species should be done to enhance Village's tree diversity.

Removals :

- Subabhl which is consider as major invasive tree species in India should not be further planted and removal of them is recommended.

Maintenance :

- Village has good population of healthy trees, but special attention should be given todiseased and dangerous trees.
- Young population of trees in Village is high and thus requires protection from gettingcut.
- Regular maintenance and pruning of mature trees will lessen the nuisances created by tree felling.
